antenna pattern control using pdf

In radio and telecommunications a dipole antenna or doublet is the simplest and most widely used class of antenna. The dipole is any one of a class of antennas producing a radiation pattern approximating that of an elementary electric dipole with a radiating structure supporting a line current so energized that the current has only one node at ...

Dipole antenna - Wikipedia

A parabolic antenna is an antenna that uses a parabolic reflector, a curved surface with the cross-sectional shape of a parabola, to direct the radio waves.

Parabolic antenna - Wikipedia

Considering the radome geometry of Figures 1 and 2, what we see is that the framework shadow on the reflector surface is a complicated geometry problem dependent on the radome diameter, panel size, the antenna diameter and antenna scan angle.

We begin with a glossary of basic definitions and then progress through a discussion of some common antenna types and their properties. Along the way, the antenna patterns are shown and explained, including the 3-D radiation pattern from the antennas.

An antenna is a device to transmit and/or receive electromagnetic waves. Electromagnetic waves are often

referred to as radio waves. Most antennas are resonant devices, which operate efficiently over a relatively narrow frequency band.
